Latent Archon — U.S. Navy & Marine Corps Capability Brief

Secure Document Intelligence for Naval Forces

UNCLASSIFIED — Approved for public distribution

Mission Relevance

Naval forces operate across globally distributed commands — from NAVAIR and NAVSEA program offices to fleet maintenance activities and Marine Corps systems commands. The sheer volume of technical data packages, acquisition documents, maintenance procedures, and operational orders demands a modern search and analysis capability. Latent Archon provides a CUI-compliant AI platform that enables Navy and Marine Corps personnel to query their documents using natural language, get cited answers, and maintain full chain-of-custody over sensitive data.

Navy & Marine Corps Use Cases

Naval Aviation (NAVAIR, Fleet Readiness Centers)

- **Aircraft maintenance intelligence** — Semantic search across NAMPs, MIMs, IPBs, and CMMs: *"What is the NDI interval for the F/A-18E wing root fitting?"* — finds the answer across multiple maintenance publications
- **Engineering investigation support** — Upload EIs, TDs, and FCFs into program-specific workspaces; query across all open investigations for a platform
- **Airworthiness document search** — Cross-reference SAR data, flight clearances, and NATOPS changes in seconds
- **CDRL management** — Organize contractor deliverables by workspace per contract; search across deliverables for compliance verification

Ship systems (NAVSEA, RMCs, Shipyards)

- **Technical manual lookup** — Search across ship-class technical manuals, PMS cards, and MRCs: *"What are the valve lineup procedures for the DDG-51 firemain system?"*
- **Availability planning** — Aggregate and search work package documents, AWRs, and departure reports across maintenance availabilities

- **Class-wide deficiency search** — Query CASREP history and 2-Kilos across an entire ship class to identify systemic material issues

Marine Corps Systems (MARCORSYSCOM, MCICOM)

- **Expeditionary logistics** — Search across TAMCN documentation, allowance lists, and equipment readiness reports
- **Ground equipment maintenance** — Semantic search across TM-series publications for USMC ground equipment: *"What is the engine oil capacity for the JLTV A1?"*
- **Force design document analysis** — Cross-reference Force Design 2030 documents, concept papers, and capability gap assessments

Acquisition & Contracting (NAVSUP, FLC)

- **Contract file intelligence** — Upload entire contract folders and query across solicitations, proposals, mods, and CLINs
- **DFARS compliance checking** — Instantly query regulatory requirements: *"What cybersecurity clauses apply to a CUI system contract?"*
- **Source selection support** — Isolate offeror evaluation documents in separate workspaces while enabling cross-reference queries

Intelligence & Operations (NIWC, Fleet Commands)

- **OPORD/FRAGORD search** — Organize operational orders by exercise or deployment; search across planning documents
- **Lessons learned** — Ingest NLLP products and post-deployment AARs; query across deployments and warfare areas
- **SIGINT/OSINT document triage** — Tag and organize CUI-level analytical products by region, topic, or mission area

---

Why Latent Archon for the Navy/USMC

Naval Need	Latent Archon Capability
CUI/FOUO protection	CMEK encryption, DLP scanning, FedRAMP-aligned controls
Navy/MC SSO (Flank Speed)	SAML 2.0 federation compatible with Flank Speed / M365
SharePoint sync	Microsoft Graph integration — auto-sync from Flank Speed SharePoint
Ship/squadron/unit isolation	Workspace-level access control — each unit or program gets its own sandbox
Cross-platform search	Query across ship classes, aircraft platforms, or programs with tag-based filtering
Audit trail	Immutable logs, every AI response traceable to source document and page
Cloud platform	

Naval Need	Latent Archon Capability
	Google Cloud Platform in us-east4 (Northern Virginia) — IL5-aligned, deployed on GCP's FedRAMP High / IL5-authorized infrastructure with Assured Workloads

---

Integration with Navy IT Environment

- **Flank Speed (Microsoft 365)** — SharePoint document sync via Microsoft Graph API with delta-based incremental updates, SAML SSO
- **Navy CAC authentication** — SAML 2.0 federation with Navy ICAM / NMCI identity providers
- **Google Cloud Platform** — deployed on GCP's FedRAMP High / IL5-authorized infrastructure; Assured Workloads already configured with IL5 compliance regime, US-only data residency, and US-person-only personnel controls; us-east4 (Northern Virginia)
- **DISA STIG compliance** — Containerized deployment follows DoD container hardening guidelines
- **NIST 800-171 / CMMC alignment** — CUI controls mapped to CMMC Level 2 requirements
- **Air-gapped deployment (prototype)** — Same codebase deploys to disconnected infrastructure via Helm charts with CAC/PIV mTLS authentication, platform-native database and AI services, and Kubernetes NetworkPolicy isolation. Enables classified workloads without forking the application.

Federal customers access Latent Archon at `fed.latentarchon.com` — a dedicated, isolated GCP environment with Assured Workloads, separate from planned SLTT and commercial tiers. Production has not been deployed but there is a functional demo accessible at `latentarchon.com`. See our trust center at `trust.latentarchon.com` for security and compliance documentation.

Scenario: Fleet Readiness Center Aircraft Maintenance

Situation: An aviation mechanic at FRC East needs to determine the NDI interval for a specific structural component on the F/A-18E. The answer is buried across multiple NAMPs, MIMs, and SRMs — thousands of pages of maintenance publications that use different terminology for the same inspection.

Before Latent Archon: The mechanic searches PDF keywords for 20+ minutes, cross-references 3 different publications, and may still miss the most current NAVAIR technical directive that updated the interval.

With Latent Archon: 1. Opens the F/A-18E maintenance workspace (pre-loaded with all NAMPs, MIMs, SRMs, and active TDs) 2. Asks: *"What is the current NDI interval for the wing root fitting on the F/A-18E? Include any recent technical*

directives that modified the original interval." 3. Gets a cited answer in seconds — including the original SRM reference AND the recent TD that changed it 4. Clicks citations to verify against the original source documents

Result: 20+ minutes of cross-referencing → instant answer with full traceability. Fewer maintenance errors from missed publications.

Getting Started

1. **Pilot program** — 30-day evaluation with a single PMA, SYSCOM directorate, or ship class team
2. **Workspace design** — Map workspaces to your organizational structure (by program, platform, or unit)
3. **Document ingest** — Bulk upload or Flank Speed SharePoint sync
4. **User onboarding** — SSO integration + 1-hour analyst training
5. **Scale** — Expand across programs, type commanders, or fleet activities
